

Compared to Sprint 1, Sprint 2 showed an increase in both scope and completion.

- Sprint 1 Velocity: 6 story points completed
- Sprint 2 Velocity: 13 story points completed

This indicates more efficient collaboration and increased output. The team was more comfortable with the codebase and tools, leading to faster implementation of features like profile personalization, checklist integration, and account management.

During Sprint 2, we expanded our scope in response to user feedback and evolving project priorities. This included adding more front-end polish for a smoother user experience and implementing new features such as order tracking and account information editing. These additions enhanced the overall usability and personalization of the platform, aligning more closely with our goal of creating a tailored dorm shopping experience.

However, we encountered some challenges that impacted our sprint pacing. One team member became inactive partway through the sprint, which required the remaining team members to quickly redistribute tasks and adjust our workload. Additionally, most story points were

completed near the end of the sprint due to delayed merges and underestimated technical complexity, particularly around syncing checklist data with dorm profile selections. Despite these setbacks, the team adapted well and successfully completed all planned work.
